From email: "Skied the ramp outside of Bridger Bowl today, saw these small NE facing crowns at 8350'. We also experienced localized cracking while skinning at the density change interface of the new and "old" snow (8-12" at this elevation by 4pm). No other observed avalanches, no other cracking and no collapsing. New snow was sluffing easily on steep terrain." Photo: D. Sandberg

Advisory Region
Bridger Range
Longitude

-110.93W
Latitude
45.83N
Avalanche Details: Small Avalanches, Ramp
Bridger Range, 2021-02-08
