Notes

Made it out past round lake around 11am this morning - dug multiple hand pits above 9400' to gauge new snow depth - 40-50 cm new snow from this storm, very light, over the hood riding! Minimal wind below alpine, upper 20cm new snow collapsed easily in hand pits, very little cohesion in the new snow.

Observed several smaller avalanches, all in new snow, undetermined whether natural or ridder triggered, attached photo of the only slide I could get an alright photo of, vis was limited.
