

YNP and Cooke instability

Date

Wed, 02/22/2023 - 14:35

Activity

Skiing

From an email:

Many collapses. HST 15cm. NSFing on the surface. Light winds out of the E, S.

Several small [wind slab](#) pockets in steep, wind loaded areas of terrain. This photo is the largest one that released. Bison, watch out!

On my drive back from the park, I noted a few others. Surprisingly, nothing on those S slopes around Meridian went.

-Old Man Rays, released mid slope, as well as a small pocket below the cliff in sympathy. SS-N-R2-D2-I(?)

-Miller Ridge, SW [aspect](#) at about 9500', large crown. That's all I could see.

Region

Cooke City

Location (from list)

Yellowstone Park NE

Observer Name

Nina Hance
