

Quick pit in the Bridgers

Date

Sun, 11/24/2024 - 10:00

Activity

Skiing

Dug near the bottom of the Apron in a zone between the Apron and NW Passage.

NE aspect, 7500 ft, 29 deg slope angle

Total depth = 95 cm

Snowpack generally good, and the lower snow is surprisingly dense and strong for an early season snowpack. Yay!! There are a couple weak layers in the upper 20 cm, one was the interface with last night's new snow and the other was some graupel, but both only produced ECTNs.

ECT results

- two ECTNs in the upper 20 or 25 cm with less than 10 taps, one ECT in the lower snowpack with about 22 or 23 taps.

Nice snow and the parking lot was filling up by the time I was back at my car.

Region

Bridger Range

Location (from list)

Bridger Bowl

Observer Name

Karl Birkeland
